CONTENTS

	Preface	v
	List of abbreviations	ix
1	DEVELOPMENT AND BASIC TERMS OF PHOTOCHEMISTRY OF COORDINATION COMPOUNDS	1
2	FORMATION AND PROPERTIES OF COORDINATION COMPOUNDS IN EXCITED STATES	5
2.1	Introduction	5
2.2	Physical conditions of the formation of complexes in excited states	5
2.2.1	Photoexcitation	5
2.2.2	Formation of complexes excited by energy transfer	8
2.2.3	Formation of excited complexes as products of a chemical reaction	10
2.2.4	Formation of excited complexes caused by application of mechanical energy	11
2.3	Electronic structure of complexes in excited states	11
2.3.1	Electron density transfer during excitation	11
2.3.2	Transfer of electron density between orbitals localized predominantly on the central atom	13
2.3.3	Electron density transfer between orbitals localized predominantly on ligands	15
2.3.4	Electron density transfer between molecular orbitals localized predominantly on the central atom and ligands	16
2.3.5	Electron density transfer between central atoms in bridged polynuclear complexes	18
2.3.6	Electron transfer between the complex and a component of its secondary coordination sphere	19
2.3.7	Electron transfer from the complex to the environment	20
2.4	Molecular structure of complexes in excited states	20
2.5	Thermodynamic properties of coordination compounds in excited states	24
3	PHOTOPHYSICAL DEACTIVATION PROCESSES	28
3.1	Deactivation modes of the excited states of coordination compounds	28
3.2	Monomolecular non-radiative deactivation processes	30
3.3	Monomolecular radiative deactivation processes	33
3.4	Energy transfer	43
3.5	Exciplex and excimer formation	47
4	PHOTOCHEMICAL REACTIONS OF COORDINATION COMPOUNDS	57
4.1	Chemical deactivation and classification of photochemical reactions	57
4.2	Photoredox reactions of coordination compounds	59
4.2.1	Photochemical formation of solvated electrons	59
4.2.2	Outer-sphere photoredox reactions of complexes	62

4.2.3 Photoredox intramolecular rearrangements 70
4.2.4 Photoredox elimination and addition reactions 72
4.2.5 Inner-sphere photoredox reactions of complexes 75
4.2.6 Photoredox reactions of polynuclear complexes 85
4.2.7 Photoredox reactions of coordinated ligands 91
4.3 Photoisomerization reactions of coordination compounds 94
4.3.1 Classification of photoisomerization reactions 94
4.3.2 Photoisomerization interconversion reactions of optical isomers 95
4.3.3 Phototautomerization reactions 98
4.3.4 Photoisomerization reactions of spin isomers 99
4.3.5 Photoisomerization reactions of coordinated ligands 100
4.3.6 Photoisomerization reactions of geometrical isomers 102
4.3.7 Linkage photoisomerization reactions of complexes 107
4.4 Photosubstitution reactions of coordination compounds 111
4.4.1 Types of complex systems involving photosubstitutions 112
4.4.2 Nature of the photoreactive excited state 120
4.4.3 Mechanisms of photosubstitution reactions 125
4.4.4 Models of photochemical reactivity 130
4.5 Photochemical insertion, elimination and addition reactions 138
4.6 Photochemical changes in composition of coordinated ligands 142

5 APPLICATIONS OF PHOTOCHEMISTRY OF COORDINATION COMPOUNDS 146
5.1 Photocatalysis 147
5.2 Solar energy conversion and storage 153
5.3 Photochemical synthesis of coordination compounds 170
5.4 Application of photochemistry of coordination compounds in the chemistry of polymers 182
5.5 Other applications 190

6 CONCLUSION 192
